Q: What are Mobile Devices?

Ans: In the computer world, the term mobile device refers to any electronic device that be easily moved from one location to another. Over time, this category has expanded to include cell phones, laptops, smartphones, smartwatches and many other portable devices.

Example:

The most common examples of mobile devices today are Smart Phone, Smart Watches, tablet computer & Laptop computer.

Mobile device history:

Laptops became one of the first mobile computing devices by eliminating the wires between the computer and its peripherals, by integrating them into one unit. The first laptop or portable computer was the IBM 5100, released in September 1975.

Today, mobile device usually refers to any hand-held computer capable of running apps that can connect to the Internet wirelessly. However, even by todays more scrupulous standards, the category keeps expanding with new inventions. As is true in any branch of computing, our mobile devices continue to offer more advanced functions while reducing size and weight.
